_____

Example: Nowadays, many people are struggling with this problem, because they think that they might make mistakes while speaking in English. Solutions for aforementioned issues:

- /θ/ (think) and /ð/ (this), for these sounds learners should practice placing the tongue between the teeth and blowing air out for /θ/

/w/ (will) and /v/ (very) learn that /w/ is made by rounding the lips without touching the upper teeth, while /v/ requires the upper teeth touching the lower lip

- /ɜ:/ (bird) and /æ/ (cat) — For this sounds, people should listen to native pronunciation and mimic the tongue placement.

In addition to this, language learners could also learn it via phone apps like YouTube or Elsa Speak ,which might increase their learning progress .

2) Ways for fixing word stress issues:

a) Use a dictionary, because utilizing online dictionary may provide for second language learners correct pronunciation. For example: Cambridge Dictionary which is useful for learners.

b) Practice with stress patterns — to be more precise, learn common rules for two-syllable and three-syllable words. So for fixing intonation issues, 1) people who are learning a target language should listen to native speakers, because by watching English TV shows or YouTube videos, they might acquire a considerable amount of knowledge about the language. In addition to the given above, a subsequent technique to fix this problem is recording yourself that is much more effective way to improve speaking skills.

3) For people who are confused between similar sounds, there are some possible solutions for this matter. In the initial place, language learners must learn how to position their tongue, lips and vocal cords to pronounce words correctly. For example, by using a mirror, learners can check their mouth movements while pronouncing tricky sounds. Another way to combat this problem is comparing with native speakers, to be more specific, people who are learning English may watch videos showing correct pronunciation and repeat them.

4) There are also some possible ways for reducing hesitation, which is thought to be a common problem for language learners. It may be caused by some factors such as lack of confidence, fear of making mistakes or limited vocabulary. However, there are some possible techniques in order to overcome this. Initially, language learners should increase their speaking confidence by accepting mistakes as learning experience, because every mistake lead people to an improvement. As well as this, a subsequent way to overcome hesitation is expanding vocabulary and sentence structures that is vital for beginners in speaking.

THE ROLE OF ARTIFICIAL INTELLIGENCE IN LEARNING ENGLISH

Adilbekova Iroda
Student, Karakalpak state university named after Berdakh
Scientific advisor: Seytniyazova Guljakhan,
Senior teacher in Karakalpak state university named after Berdakh

Abstract. In the last few years, artificial intelligence (AI) has become an integral part of English language learning. In this article, I will discuss some of the most popular AI tools like ChatGPT,

Grammarly, and Duolingo, and how they help students and teachers alike. I will highlight the opportunities they offer, as well as the challenges we face when integrating AI into language learning. The main focus is on how combining traditional learning methods with AI technology can enhance the learning experience.

Key words: English language, artificial intelligence, ChatGPT, education, digital technologies

Introduction. It seems hard to believe that just a few years ago, AI in education felt like something out of science fiction. Fast forward to today, and AI tools are everywhere—especially in language learning. As a student myself, I've found tools like ChatGPT, Grammarly, and Duolingo to be incredibly helpful in my daily studies. But I'm not alone: many students are using these tools, too, to enhance their learning experience.

For example, I used ChatGPT to practice for a job interview. Instead of just reading textbooks or listening to others, I could have real conversations with the AI, getting instant feedback on my responses. This made a huge difference in my confidence. Similarly, Duolingo has become my go-to app for quick daily practice, while Grammarly has saved me hours of correcting my essays. These tools are transforming the way we learn and interact with language.

This article aims to explore how AI is shaping the way we learn English, what new possibilities it opens, and what difficulties we still face. I'll share examples from my own experience to make it feel more real and relatable.

Literature Review and Methods. AI in education is not exactly new, but its impact is growing exponentially. Recent studies show that AI is playing a huge role in personalizing education, making learning more tailored to individual needs (Oxford, 2017; Kukulska-Hulme, 2020). From my own experience, I've noticed that tools like ChatGPT and Duolingo don't just teach vocabulary—they make learning interactive and fun.

For instance, in a study by Pimenova (2021), it was found that voice assistants helped students improve their pronunciation by 30% in just a few months. I can vouch for this because I used AI tools like voice assistants to work on my speaking skills, and I noticed clear improvements in how I pronounce difficult words.

This article uses my own learning experiences with AI tools to show how they work in practice. I'll also look at some studies to back up the points I'm making.

Discussion. Let's take a closer look at the AI tools I use and how they've impacted my learning.

ChatGPT has been a game changer for me. It's not just a chatbot; it's like a personal tutor who's available 24/7. I've used it to practice everything from everyday conversations to more specific topics, like preparing for job interviews. I remember practicing with ChatGPT before an interview. I could type out my responses and get feedback on how to improve them, which gave me so much more confidence. It's amazing how much the AI can help you refine your speaking and writing skills—almost like having a conversation with a real person.

Grammarly is another tool I use almost daily. It's more than just a spelling checker; it actually explains why certain things are wrong and how to fix them. One of my classmates told me how Grammarly helped him write better essays for university, and I can relate. It's not only about fixing grammar mistakes but also about learning from them. When I was writing an essay about AI's role in education, Grammarly helped me improve my sentence structure and vocabulary, making my work sound much more polished.

Duolingo is my favorite app for practicing vocabulary.

It's kind of like a game, and I find that fun! Duolingo motivates me to complete daily lessons by rewarding me with points and showing me my progress. I'm not the only one—it's really popular among students. A friend of mine, who was preparing for an English exam, told me that using Duolingo every day kept him on track with his learning and helped him feel more prepared. The app's structure is simple yet effective, and the small tasks help you stay consistent with your learning.

Benefits of AI in English Language Learning:

• Personalized learning: These tools adapt to your level, needs, and preferences. This makes learning much more efficient.

• Learning anytime, anywhere: You're not restricted to a classroom. With AI, learning can happen whenever and wherever you want.

• Motivation through gamification: Apps like Duolingo turn learning into a game, which keeps you engaged.

• Instant feedback: Instead of waiting for a teacher's correction, you get immediate feedback that helps you improve right away.

• Increased engagement: AI makes learning more interactive, which keeps you interested and motivated.

Challenges:

• No emotional connection: AI tools can't replace the emotional support and human connection a teacher provides.

• Occasional mistakes: AI sometimes gets things wrong, especially when it comes to context or more complex sentences.

• Cultural nuances: AI tools might miss cultural context or specific teaching methods, which can affect the learning experience.

Conclusion. AI is changing the way we learn English, and I'm excited to see where it takes us. Tools like ChatGPT, Grammarly, and Duolingo have already helped me—and many others—improve our language skills in ways that would have been impossible without these technologies. However, it's important to remember that AI isn't a replacement for traditional teaching methods. Instead, it should complement them.

By combining AI tools with the support of teachers and human interaction, we can create a learning environment that truly benefits students. As someone who has experienced the power of AI firsthand, I believe it's the future of language learning, but it's crucial to find the right balance between technology and human involvement.
